

Reinforcement Learning - Continuous Cartpole

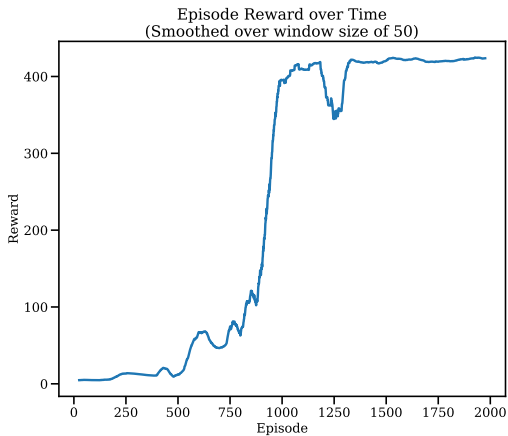

Aron Distelzweig

Project

Approach

- Actor Critic method because of continuous action and state space
- Reward function: The smaller the angle, the higher the reward
- First approach: Deep Deterministic Policy Gradient (DDPG)
- DDPG shows unstable performance
- Turn DDPG into TD3 by adding the following three adjustments
 - Clipped Double Q-Learning
 - Delayed Policy Updates
 - Target-policy smoothing

Results - TD3

Results - TD3

Number of Steps in each Episode
(Smoothed over window size of 50)

Angle in each Time Step over Different Episodes

Position in each Time Step over Different Episodes

Velocity in each Time Step over Different Episodes

Results - DDPG

Number of Steps in each Episode
(Smoothed over window size of 50)

Angle in each Time Step over Different Episodes

Position in each Time Step over Different Episodes
